

Agile

1. Complete these user stories:
 - As a vanilla git power-user that has never seen GigggleGit before, **I want to have access to a service that facilitates the merging process while providing entertainment.**
 - As a team lead onboarding an experienced GigggleGit user, **I want to have a seamless transition of that user's work through the use of memes.**
2. Create a third user story, one task for this user story, and two associated tickets.
 - Tasks should be a single phrase. (As should themes and epics. See those provided.)
 - User stories should be one to three sentences.
 - Tickets should have a title consisting of a single phrase and details that are long enough to sufficiently describe what needs to be done. You do not need to assign points to the tickets
 - i. **User Story 3: As a product manager, I want to have effective auditing capabilities through the use of memes to facilitate activity and security tracking.**
 - ii. **Task: Bridge the classification of memes based on the type of merges they track with practical implementation.**
 - iii. **Ticket 1: Design a database that tracks memes by function**
 - iv. **Ticket 2: Design a container that provides access to that database.**
3. This is not a user story. Why not? What is it?
 - As a user I want to be able to authenticate on a new machine
 - **It does not provide a reason for why a new machine is helpful or a worthy goal.**

Formal Requirements

1. List one goal and one non-goal
 - **Goal: Implement voice recognition technology so that a snicker will effectively result in a sync.**
 - **Non-Goal: Activate git through voice command**
2. Create two non-functional requirements. Here are suggestions of things to think about:
 - Who has access to what
 - PMs need to be able to maintain the different snickering concepts
 - A user study needs to have random assignments of users between control groups and variants
 - **Non-Functional Requirement 1: Security**
 - i. **Tracking tone and pitch to ensure correct person is snickering**
 - ii. **Syncs only work with desired repositories and directories**
 - **Non-Functional Requirement 2: Differentiation**
 - i. **Implement a base recording mapped to a sync so a snicker can be to that base recording to determine the correct function.**
 - ii. **Keep a database of different functions mapped to different snickers**
3. For each non-functional requirement, create two functional requirements (for a grand total of four functional requirements).
